

PresSheet

Presentation Sheet Generator

Release 1.0.0

Build 2026.06

[User Guide](#)

OVERVIEW

What is PresSheet?

PresSheet is a lightweight presentation sheet generator designed for architectural visualisation, interior design, landscape architecture, and branding workflows. It applies consistent headings, watermarks, project metadata, and studio branding to any folder of render images — producing polished, client-ready sheets in a single batch operation.

Architectural Visualisation	Overlay project data and studio branding onto render outputs.
Presentation Boards	Assemble multi-image sheets with uniform typography.
Landscape & Interior Design	Batch-brand complete image sets for client delivery.
Design Studios	Enforce consistent visual identity across all deliverables.

INSTALLATION

Getting Started

PresSheet requires no installer. It ships as a self-contained executable inside a compressed archive. Follow the steps below to get up and running.

- 1

Extract the Archive

Open the downloaded **.RAR** archive using WinRAR, 7-Zip, or the Windows built-in extraction tool. Extract all contents to a location of your choice.
- 2

Locate the Executable

Inside the extracted folder, navigate to the **dist** folder.
- 3

Launch the Application

Run **PresSheet.exe** from within the **dist** folder. No installation wizard, runtime dependencies, or administrator privileges are required.

Important: Keep all extracted files inside the original folder structure. Moving PresSheet.exe outside the dist folder will prevent the application from launching.

Supported Input Formats

JPG / JPEG	PNG	TIFF / TIF
------------	-----	------------

QUICK START

Workflow Overview — 10 Steps

The workflow below describes the complete configuration sequence. Steps 1–2 define your source and destination, Steps 3–7 control visual appearance, and Steps 8–10 govern output and processing.

- 01

Input Folder

— Select the folder containing your render images.

02

Output Folder

— Select the destination folder where generated sheets will be saved.

03

Heading

— Heading text — Font — Font size — Colour

04

Watermark

— Text & separator characters — Font & font size — Opacity — Letter spacing — Position

05

Project Information

— Project Name — Client — Architect — Custom field labels

06

Studio Branding

— Role label — Studio name — Subtitle — Brand colour — Studio font — Logo image

07

Style

— Top border size — Bottom information bar size — Separator thickness — Text colours

08

Output Settings

— Output format — JPEG quality — Overwrite existing files

09

Preview

— Click Preview to generate a sample sheet. No files are saved during preview.

10

Process

— Click Process All to batch-process every image in the selected input folder.

NOTES**Behaviour & Constraints****■ Non-Destructive Processing**

Original image files are never modified. PresSheet writes all output to the designated output folder only.

■ Preview Mode

Generating a preview does not write any files to disk. It is intended for configuration verification only.

■ Batch Processing

Process All operates on every supported image file found in the selected input folder. Sub-folders are not traversed.

■ Overwrite Behaviour

By default, existing output files are preserved. Enable the overwrite option in Output Settings to replace files with matching names.

■ Custom Fonts

Both TTF (TrueType) and OTF (OpenType) font files are supported. Point to the font file path in the relevant font selector field.

TROUBLESHOOTING**Common Issues & Resolutions**

**Fonts Not Loading**

Verify that the selected font file exists at the specified path and that it is a valid TTF or OTF file. Corrupt or incomplete font files will not load correctly.

**Images Not Appearing**

Confirm that image files are located directly inside the selected input folder and that they use a supported format (JPG, JPEG, PNG, TIFF, or TIF).

**Permission Errors on Save**

Ensure the output directory is writable by the current user account. On Windows, avoid writing to system-protected directories such as Program Files.

**Logo Not Displaying**

The studio logo must be a valid PNG file. Verify that the file path configured in Studio Branding is correct and the file is not corrupted.

**Application Does Not Start**

Ensure all extracted files remain inside the original folder structure and that PresSheet.exe is launched from within the dist folder. Relocating the executable outside this structure will break relative file references.
